DD312

HIGH CONSTANT CURRENT LED DRIVER
with ERROR DETECTION

General Description

DD312 is a high constant current driver designed for LED lighting application and power LEDs. It incorporates a constant current circuitry with current value set by an external resistor. The output enable terminal allows dimming control by system. The fast response of output current can adapt to high dimming resolution and high refresh rate applications. Built-in LED open detection, over temperature, and over current protection functions ensure the system reliability.

Features

- Maximum output current: 1A (determined by the external resistor)
- Minimum output voltage: 1V (Iout = 1A)
- Maximum output voltage: 18V
- Output enable terminal: 1MHz (max.)
- Supply voltage range: 5V ~ 18V
- Over current protection
- Thermal shutdown
- Thermal alarm (SOP8 only)
- LED open detection (SOP8 only)

Applications

- LED architectural or entertainment lighting
- LED general or specialty illumination
- LED backlighting applications

Package Types

- TO-252 or SOP8 (with thermal pad)

Block Diagram

Pin Connection

Pin Description

PIN No.	PIN NAME	FUNCTION
TO252:3/SOP8:1	GND	Ground terminal.
TO252:5/SOP8:2	EN	Output current enable terminal.
TO252:2/SOP8:3	OUT	Sink constant current outputs (open-drain).
SOP8:4	RESERVED	Terminal for testing, user should leave this pin open.
TO252:1/SOP8:5,6	REXT	External resistor connected between REXT and GND for driver current value setting.
SOP8:7	ALARM	Output open drain terminal: (connected to a pull-high resistor) '**H**' for normal conditions, '**L**' for LED open or chip overheated.
TO252:4/SOP8:8	VCC	Power supply terminal.

DD312

Constant-Current Output

Constant-current value of each output channel is set by an external resistor connected between the REXT pin and GND. Varying the resistor value can adjust the current up to 1A. Notice that the output current is a little increasing or decreasing until the device temperature and ambient temperature are balance. Another thing should be considered is that the maximum power dissipation of the determined external resistor should be large enough than the actual power consumption: $0.5(V) \times Iout(A)$. Approximate output current value can be calculated by following equation:

$$IOUT\,(A) \simeq 0.5\,(V)\,/\,REXT\,(\Omega)$$

Output Current as a Function of REXT value

Vout = 1.0 V
Output Current as a Function of Output Voltage

DD312

Power Dissipation

Notice that the power dissipation of a semiconductor chip is limited to its package and ambient temperature, in which the device requires the maximum output current calculated for given operating conditions. The maximum allowable power consumption can be calculated by the following equation:

$$Pd(max)(Watt) = \frac{Tj(junction\ temperature)(max)(\,^{\circ}\!C) - Ta(ambient\ temperature)(\,^{\circ}\!C)}{Rth(junction\text{-}to\text{-}air\ thermal\ resistance)(\,^{\circ}\!C/Watt)}$$

The relationship between power dissipation and operating temperature can be refer to the figure below:

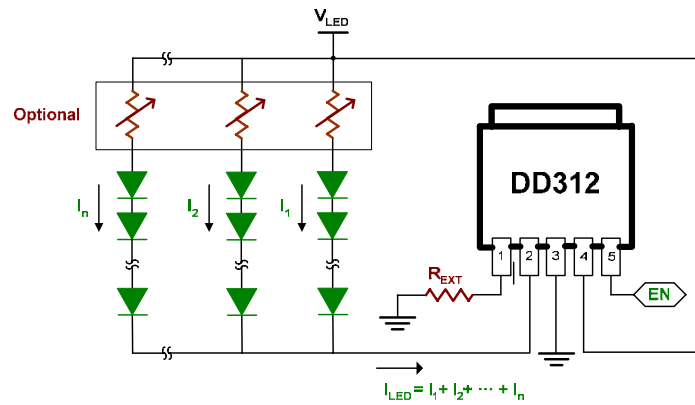

Based on the Pd(max), the maximum allowable voltage of output terminal can be determined by the following equation:

$$Vout(max)(Volt) = \frac{Pd(max)(Watt) - V_{DD}(Volt) \times I_{DD}(A)}{Iout(A) \times Dimming\ Duty}$$

DD312

Typical Application

DD312 is specifically designed to withstand high frequency switching signal (1Mhz max) while providing high current driving capability. By connecting ENABLE pin to a PWM signal output, system will adapt to precise dimming control. In this display of a typical application, a PWM enabled RGB driver DM413 is configured to act as PWM signal generator. Through serial data input, DM413 can generate maximum of 14 bits RGB PWM grayscale signal to control a set of three DD312. The combination of DD312 and DM413 offers an ideal solution for high end grayscale control and color manipulation.
